

What this app is

NoWalletConnect is a receive screen for USDT. You (the receiver) open it on your phone or laptop. The sender never logs into this page. They open their own wallet, scan or copy your address, and send USDT.

There is no WalletConnect popup and no browser wallet extension on your side. Confirmation comes from a Cloudflare Worker that checks Polygon (Etherscan) or Solana (Helius).

Who does what

You · receiver

- Save your receive addresses
- Pick Polygon or Solana
- Type the exact USDT amount
- Show the QR / address
- Wait for Payment received

Them · sender

- Open their own wallet app
- Scan QR or paste address
- Choose USDT (not POL / SOL)
- Same network as the screen
- Send the exact amount shown

Quick start

1 Add your wallets

Tap the settings button (bottom-right). Paste your Polygon address (starts with 0x) and/or your Solana address. Save. Addresses stay in this browser only.

2 Choose the network

Pick Polygon or Solana on the first screen, then Continue. Use the same network the sender will use. They are not interchangeable.

3 Type how much they should send

On checkout, enter the USDT amount. Leave it empty until you know the price. Watching starts when a valid amount is entered.

4 Show the QR

The QR is your raw receive address so more wallets can scan it. They can also use Copy address. Tell them: USDT only, this network, this amount.

5 Wait on this screen

You do not tap “I sent it.” The page checks the chain every 5 seconds. When a matching incoming USDT transfer is found, you get Payment received and an explorer link.

How confirmation works

The page calls a backend Worker. API keys never sit in the website. A payment counts as paid only if all of this is true:

- **Right wallet.** Sent to the receive address saved in Settings.
- **Right token.** USDT on Polygon (ERC-20) or USDT on Solana (SPL).
- **Right amount.** Within 0.01 USDT of the number you typed.
- **Recent enough.** The transfer is newer than the look-back window (about 30 minutes).

Checkout watches for 15 minutes and shows time left. Check again starts a new window. Accept another payment clears the amount so the last sale is not reused.

Settings

Polygon address — Ethereum-style account on Polygon. Must start with 0x. This is where Polygon USDT arrives.

Solana address — Solana public key. This is where Solana USDT arrives.

If no address is saved for the network you picked, checkout shows Set a receive address instead of a blank QR. Save, and the QR appears without a full page reload.

Supported networks

Polygon

Token: USDT (ERC-20)

Usually confirms in seconds to ~30s

Low fees. Use for most transfers.

Solana

Token: USDT (SPL)

Usually confirms in seconds

Very low fees. Instant feel.

What this app is not

It is not WalletConnect, not a custody wallet, and not a guaranteed settlement system. It does not lock the token inside the QR. It does not give invoices, refunds, or a payment history. Two people sending the same amount to the same address in the same window can look like one payment.

Use it when you can watch the screen. Do not treat the green page as legal proof by itself — open the explorer link.

If something goes wrong

Nothing happens after they pay

Wrong network, they sent POL or SOL instead of USDT, or the amount is not within 0.01. Ask them to show the explorer. Compare network, token, amount, and destination.

QR will not scan

The code is only the address. Use Copy address and paste it in their wallet. Then they must still pick USDT on the network shown on your screen.

Can't check the payment right now

The page could not reach the verifier (often the wrong site origin). Use the official github.io link, not a raw HTML file, unless local testing is allowed on the Worker.

It confirmed an old payment

The same amount to the same wallet inside the look-back window can match again. Use a different amount for the next sale, or wait and start a fresh checkout.

Settings vanished

Addresses are stored in this browser only. Another phone, private window, or cleared site data means you must paste them again.

Checkout timed out

The 15-minute watch ended. Tap Check again if they already sent, or type the amount once more.

Before you take a real payment

Send a tiny USDT test to yourself on each network you plan to use. Confirm Payment received and open the explorer link. Only then take customer funds.

Say this out loud to the sender: “USDT on [Polygon or Solana], exactly [amount], to this address.” Wrong asset on the right address can still be lost.

One line for the sender

Scan or copy → USDT only → same network as the screen → exact amount.
