

NoWalletConnect

Crypto Payment Receiver App

What is NoWalletConnect?

NoWalletConnect is a simple, standalone app for receiving crypto payments in USDT. No wallet extensions needed. Just scan a QR code and get paid. Supports both Polygon and Solana networks.

Quick Start

1. Configure Your Wallet

Click the  settings button (bottom-right) and enter your receiver wallet addresses for Polygon and Solana.

2. Select Network

Choose whether you want to receive on Polygon or Solana. Polygon is fast and cheap. Solana is instant.

3. Enter Amount

Type how much USDT you want to receive (e.g., 50 USDT).

4. Share QR Code

A QR code appears. Share it with the person paying you. They scan it with their wallet.

5. Confirm Payment

Click 'I've Sent the Payment' and the app automatically checks the blockchain. When it finds your transaction, it shows a success screen.

Features

- ✓ No wallet extension required
- ✓ Works with Polygon and Solana
- ✓ Automatic blockchain verification
- ✓ See transaction hash on explorer

- ✓ Custom wallet configuration
- ✓ Beautiful, modern interface
- ✓ Mobile-friendly design

Settings

Polygon Address

Your Ethereum-compatible wallet address on the Polygon network. Must start with 0x.

Solana Address

Your Solana wallet public address. Will be saved in your browser for next time.

How It Works

1. Blockchain Scanning

When you click 'I've Sent the Payment', the app starts checking the blockchain every 5 seconds for up to 75 seconds. It looks for incoming USDT transactions to your wallet.

2. Payment Verification

The app checks:

- Is the transaction sent to your wallet?
- Does the amount match (within 0.01 USDT)?
- Is the transaction recent (within 45 minutes)?

3. Success

Once payment is found, you see a confirmation screen with the transaction hash. Click the hash to verify on-chain.

Supported Networks

Polygon (MATIC)

Fast, cheap transactions. Good for international payments. Verification takes 5-30 seconds on average.

Solana (SOL)

Instant transactions. Very cheap fees. Verification is instant or within seconds.

Troubleshooting

Payment not found?

Check that your wallet address is correct in settings. Make sure the sender used the right network.

QR Code not scanning?

Make sure you're using a standard crypto wallet app. The QR code uses ethereum: or solana: protocol.

Transaction shows but not verified?

The app checks for exact amount (within 0.01 USDT). Make sure the sender sent the correct

amount to your wallet.

Settings not saving?

Clear browser cache or try a different browser. Your settings are stored locally in your browser.

Pro Tips

- Test with a small amount first to make sure everything works
- Use Polygon for most payments - it's faster and cheaper
- Keep your wallet addresses private and secure
- Bookmark this page for quick access
- Works best on modern browsers (Chrome, Firefox, Safari, Edge)
